

## Nitrogen and Sulfur

- Nitrogen, most abundant gas 78%
- highly unreactive because
  - the molecule is non-polar
  - N≡N bond is really strong, so a lot of energy is required.
- Oxides of nitrogen
  - Nature's way → Lightning provides energy for  $\text{N}_2$  and  $\text{O}_2$  to react.
  - Manmade →  $\text{N}_2$  and  $\text{O}_2$  combine in hot engines of cars
- Problems w/ oxides of nitrogen
  - they cause acid rain  $\rightarrow 2\text{NO}_2 + \frac{1}{2}\text{O}_2 + \text{H}_2\text{O} \rightarrow 2\text{HNO}_3$
  - they cause photochemical smog
  - acid rain  $\rightarrow \text{NO}_2 + \text{SO}_2 \rightarrow \text{NO} + \text{SO}_3$   
 $\text{SO}_3 + \text{H}_2\text{O} \rightarrow \underline{\text{H}_2\text{SO}_4}$   
 acid rain
- Ammonia and Ammonium
  - ammonia is made from the Haber process, which uses high temp, high pressure, Iron as catalyst.  $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$
  - ammonia is a weak base, it turns damp red litmus blue.
  - ammonia + acid  $\rightarrow$  ammonium
  - ammonium + base  $\rightarrow$  ammonia.
  - ammonium compounds are used in fertilizers.
  - $\text{NH}_4\text{NO}_3$   $\rightarrow$  best fertilizer
  - Nitric acid is formed from ammonia, used to make detergents and dyes.
  - ammonia +  $\text{HNO}_3 \rightarrow \text{NH}_4\text{NO}_3$
  - Nitrate fertilizers get washed away in rivers  
 algae grows, algae blocks sunlight from entering water  
 algae dies, bacteria feed on it using the dissolved  $\text{O}_2$   
 aquatic life suffers due to lack of oxygen.

This is called EUTROPHICATION.

- Sulfur and its oxides
- Sulfur is present in some fossil fuels.
- When fossil fuels are burnt, the sulfur is oxidised to sulfur dioxide gas, which causes acid rain.
- Sulfur is solid at r.t.p.

- Sulfuric acid
- $H_2SO_4$
- used in fertilizers, detergents, and dyes.
